

Neztek Data Exchange Utility

Neztek Data Exchange Utility

Good decisions come from good data. Interfacing CCTV data with your Hansen enterprise provides a fast, reliable method of transferring survey data into the Hansen database. You save hours of update time and eliminate errors. You are assured of associating the correct section of pipeline to the Hansen asset.

Save Time and Effort

The Neztek Data Exchange Utility (NDEU) is middleware that works as a data transfer tool between the CCTV truck software and the Hansen enterprise. NDEU creates an intermediate database that is a two-way data staging and loading utility. Before an inspection, the supervisor uses NDEU to export Hansen Group Project data and loads the file onto the CCTV data collection computer. As the inspection continues, information about defects and problems is collected and recorded. Back at the office, the supervisor reviews the changes to asset data. When satisfied with the quality of information, she imports the survey information into Hansen. The data is clean, free from extraneous information and updated in one swift step.

Flexible and Versatile

Unlike hard-coded data transfer products, NDEU allows you to work with any CCTV vendor. Each truck software vendor you use simply outputs the header information in NDEU's published format. Integration with the survey software usually takes just minutes. This flexibility means that you can work with multiple CCTV vendors and have only one "handshake" point with the Hansen enterprise.

Transferring the Data

At any time during the survey, you can use NDEU to transfer data to the Hansen enterprise. The data transfer updates the survey headers and work orders, and adds the observations and pictures. The Hansen user can also create new assets that the survey uncovered. After viewing the variance reports, you can automatically update asset attributes, such as lengths, diameter, material, location or surface cover.

NDEU Benefits

- * Easy to use
- * Fast and accurate transfer of survey data to the Hansen enterprise
- * Supports multiple CCTV vendors
- * Automatically updates asset variances
- * Produces a range of printable reports, including Asset Variance

Technical Features at a Glance

- * Available for Hansen Version 7.5 Stormwater and Sewer modules
- * Runs on Microsoft Windows 9x, NT 4 and 2000
- * Supports SQL Server and Oracle databases
- * Uses Microsoft Access data and header formats

Hansen and Neztek

Neztek Systems Ltd is a New Zealand-based software developer and a Hansen Australasia partner. Under the terms of our partnership, Hansen provides marketing and technical support for NDEU.
